

OUR ENERGY POLICY

AbbVie Energy Policy

Introduction

Pioneering. Achieving. Caring. Enduring.

These are the core values that connect our past to our future, rooting us in a 125-year history of deeply held principles. They drive how we treat our patients and each other, design our strategies and operate our business. They serve as the lens through which we view and evaluate our actions. Likewise, AbbVie recognizes the importance of social responsibility and the need to establish a sound energy policy to minimize our impact on the environment.

In our efforts to develop breakthrough medicines that have a remarkable impact on peoples' lives, we recognize the need to protect the environment for future generations. It is therefore our commitment to pursue the environmentally responsible purchasing and use of energy.

Accountability

There is a consensus in the field of science regarding climate change and the role of greenhouse gases (GHG). Carbon dioxide released by burning fossil fuel is the leading cause of human activity related GHG which collect in the atmosphere, where they have potentially negative long-term consequences. We believe that AbbVie has an obligation to act responsibly by implementing efforts to reduce the consumption of fossil fuel and to reduce our GHG emissions.

Policy Statement

AbbVie is taking steps to reduce carbon emissions through the efficient use of energy in developing and delivering our products. We hereby commit to a strong energy management program which includes a systematic approach involving:

- Setting long-term emissions reduction targets
- Driving short-term and long-term energy efficiency improvements
- Incorporating energy efficient design into the construction of our new buildings, plants and facilities
- Partnering with key suppliers and vendors on emissions reduction improvements
- Promoting energy efficiency within our vehicle fleet
- Implementing renewable energy projects

Scope

This policy applies to all employees, visitors and contractors who influence or impact our use, procurement or conservation of energy. This policy is fully endorsed by AbbVie management and establishes a global framework to manage greenhouse gas emissions from our operations, facilities and activities throughout the world.
